

IMPACT OF COUNTRIES' WEALTH ON SOCIAL OUTCOMES

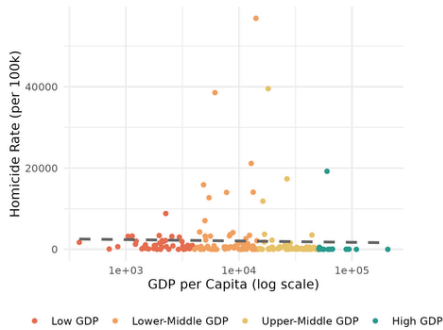

How GDP per Capita Relates to Murder Rates, Life Expectancy, Population Size, & Fertility (2020)

By Kelyn Kiecza, Brady Lees, Malin Adams

	MONACO	Wealthiest vs Poorest Country:	SOUTH SUDAN	
207844.7	GDP Per Capita	386.677		
38050	Population	10698467		
80.06	Life Expectancy	63.25		
2.38	Fertility Rate	4.16		
0.13	Murder Rate	1718.31		

Seeing the contrast between Monaco (the wealthiest country) and South Sudan (the poorest country) led us to hypothesize that a country's wealth most likely relates to its social outcomes. To explore this, we created scatterplots that look at the relationship of GDP per capita to population size, life expectancy, fertility rate, and murder rate.

GDP Per Capita vs Murder Rate
Year: 2020

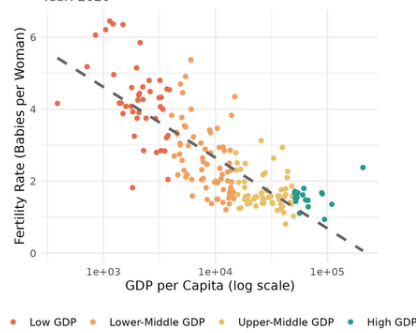

GDP Per Capita vs Population Size
Year: 2020

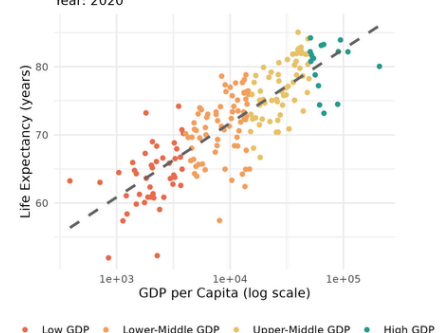

The two graphs on the left show that GDP per capita has no correlation to murder rate or population size. Therefore, a country's wealth alone does not predict its murder rate or its size. External factors like government type, law enforcement practices, or cultural factors more likely influence murder rate and population size.

The two graphs on the right show that GDP per capita is correlated to life expectancy and fertility rate. As a country's wealth increases, life expectancy rises, and the fertility rate declines. Wealthier countries have long life expectancies because they are able to afford access to good healthcare and nutrition. The fertility rate decreases amongst wealthier countries because of improvements in women's education, access to reproductive healthcare, and greater economic security, which reduces the need for large families. source: <https://tinyurl.com/33b4nd88>

GDP Per Capita vs Fertility Rate
Year: 2020

GDP vs Life Expectancy
Year: 2020

Overall Findings: GDP per capita has a nuanced relationship with social outcomes. While wealth shows no meaningful correlation with murder rates or population size, it is strongly linked to life expectancy and fertility. Wealthier nations live longer and have fewer children due to better healthcare, education, and economic security.
